1. Project Overview

The HRMS (Human Resource Management System) is designed to simplify and manage key employee-related processes within an organization. This system focuses on managing the employee lifecycle, including basic employee information, leave requests, and approval workflows between employees, managers, and the HR team.

In many organizations, processes such as leave application and approval are still handled manually or through emails and spreadsheets, which can lead to delays, lack of transparency, and difficulty in tracking requests. This system aims to address these challenges by providing a centralized platform where employees can apply for leave, managers can review and approve requests, and HR can maintain proper records efficiently.

2. Problem Statement

In many organizations, employee leave management and related processes are handled manually through emails, messages, or spreadsheets. This approach often leads to delays in approvals, lack of proper tracking, and miscommunication between employees, managers, and the HR team.

Employees may not have clear visibility on the status of their leave requests, and managers may miss or delay approvals due to unstructured communication. For HR teams, maintaining accurate records and ensuring consistency becomes challenging, especially when data is scattered across different sources. This results in inefficiencies, increased manual effort, and a higher chance of errors in managing employee information and leave records.

3. Business Objectives

The main objective of this project is to improve the efficiency and transparency of employee leave management and related HR processes. The system aims to reduce manual effort and provide a structured approach to handling employee requests.

- To automate the leave application and approval process
- To reduce delays in manager approvals and improve turnaround time
- To provide a centralized system for managing employee leave records
- To improve visibility of leave status for employees and managers
- To minimize errors caused by manual tracking and communication
- To support HR teams in maintaining accurate and organized records

4. Scope

4.1 In Scope

The following features and functionalities are included in this system:

- Employee login and basic profile access
- Leave application by employees
- Leave approval/rejection by managers
- Notification of leave status updates
- HR access to view and manage leave records
- Basic tracking of employee leave history

4.2 Out of Scope

The following functionalities are not included in this phase of the project:

- Payroll processing and salary management
- Integration with external systems (e.g., third-party HR tools)
- Advanced analytics or reporting dashboards
- Mobile application development
- Performance management and appraisal system

5. Stakeholders

The following stakeholders are involved in the HRMS system and play a key role in its usage and implementation:

Stakeholder	Role
Employee	Applies for leave and views leave status
Manager	Reviews and approves/rejects leave requests
HR Team	Manages employee records and monitors leave data
IT Team	Develops and maintains the system
Project Manager	Oversees project progress and ensures timely delivery

6. Stakeholder Matrix

The stakeholder matrix helps identify the level of influence and interest each stakeholder has in the project. This helps in planning communication and involvement throughout the project.

Stakeholder	Role	Influence	Interest
Employee	Applies for leave and tracks status	Low	High
Manager	Approves or rejects leave requests	High	High

HR Team	Manages employee data and leave records	High	High
IT Team	Develops and maintains the system	Medium	Medium
Project Manager	Oversees project execution and delivery	High	High

7. High-Level Requirements

The following high-level requirements define the key functionalities expected from the HRMS system to support employee lifecycle and leave management processes:

- The system should allow employees to log in securely and access their profile
- The system should allow employees to apply for leave by providing necessary details
- The system should enable managers to review and approve or reject leave requests
- The system should notify employees about the status of their leave requests
- The system should allow HR to view and manage employee leave records
- The system should maintain a history of leave applications for tracking and reference
- The system should ensure that only authorized users can access specific functionalities

8. Functional and Non-Functional Requirements

8.1 Functional Requirements

Functional requirements describe the core functionalities that the system should perform to meet business needs.

- The system should allow users to log in using valid credentials
- The system should allow employees to submit leave requests
- The system should allow managers to approve or reject leave requests
- The system should update and display the status of leave requests
- The system should allow HR to access and manage employee leave data

8.2 Non-Functional Requirements

Non-functional requirements define the quality and performance aspects of the system.

- The system should be accessible to users with valid login credentials only
- The system should respond to user actions within a reasonable time

- The system should ensure data security and confidentiality
- The system should be easy to use and user-friendly
- The system should be available during working hours without major downtime

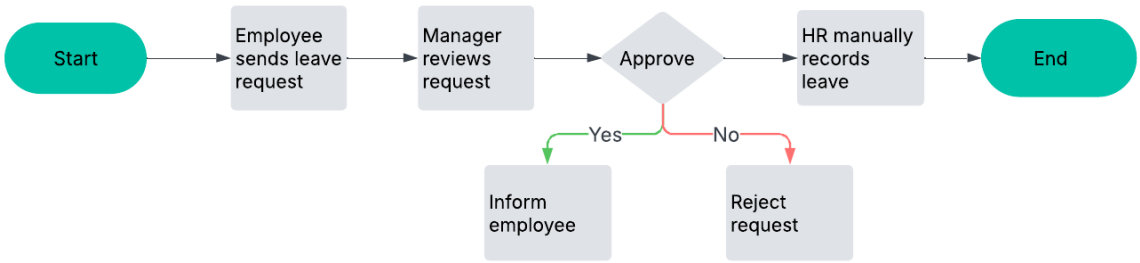
9. Business Process Flow

The current (AS-IS) and proposed (TO-BE) process flows for the leave management process have been created to understand the existing challenges and define the improved workflow using the HRMS system.

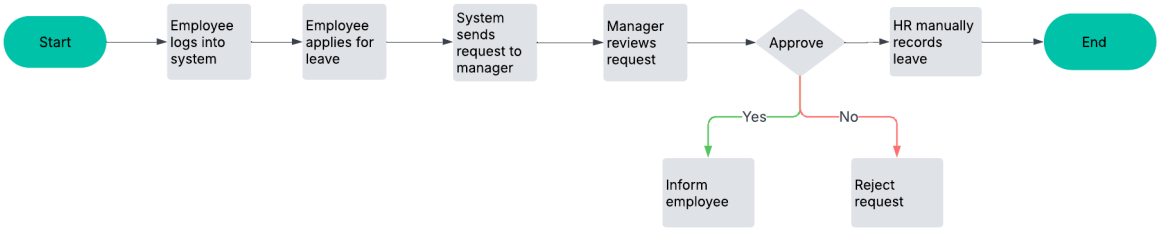
- AS-IS Process Flow: Represents the current manual process of leave request and approval
- TO-BE Process Flow: Represents the proposed automated workflow using the HRMS system

Refer to the attached process flow diagrams for detailed visualization.

AS-IS Process Flow:



TO-BE Process Flow:



10. Assumptions

The following assumptions have been considered while defining the requirements for the HRMS system:

- All users (employees, managers, and HR) will have access to the system with valid login credentials
- Users will have basic knowledge of using a web-based application
- Internet connectivity will be available for accessing the system

- Employees will follow the defined process for applying leave through the system
- Managers will review and respond to leave requests within a reasonable time
- HR team will maintain and monitor employee leave records regularly

11. Constraints

The following constraints have been identified for the HRMS system project:

- The project needs to be completed within a limited timeline
- The system will be developed with limited resources and tools
- The system will initially support only basic leave management features
- The design and functionality must align with existing company policies
- The system will be accessible only through web and not through a mobile application in this phase

12. Success Criteria

The success of the HRMS system will be measured based on improvements in efficiency, accuracy, and user experience in managing leave requests and employee records.

- Reduction in time taken for leave approval compared to the manual process
- Improved visibility of leave request status for employees and managers
- Reduction in errors related to manual tracking of leave records
- Increased efficiency in managing and maintaining employee leave data by HR
- Smooth and consistent usage of the system by employees, managers, and HR team

13. Glossary

Term	Definition
HRMS	Human Resource Management System used to manage employee-related processes
Employee	A user who applies for leave and accesses the system
Manager	A user responsible for approving or rejecting leave requests
HR Team	Responsible for managing employee records and monitoring leave data
Leave Request	A request submitted by an employee to take time off
Approval Workflow	The process of reviewing and approving or rejecting a leave request
UAT	User Acceptance Testing to validate system functionality before final use
RTM	Requirement Traceability Matrix used to track requirements and test cases

14. Appendix – Approval and Sign-off

The following stakeholders have reviewed and approved the Business Requirements Document for the HRMS system.

Name	Role	Signature	Date
HR Manager	Business Stakeholder		
Project Manager	Project Owner		
IT Lead	Technical Stakeholder
